

Energy Conservation Tips

How can I help conserve?

Replace incandescent lighting with highly efficient fluorescent or LED lighting.

Using a power strip as a central “turn off” switch for electronics will save you significant “phantom power” for equipment on standby, including chargers and power adapters.

Phantom power is power which is utilized by an equipment which is plugged in to an outlet but not in use.

The refrigerator is likely to be one of the largest energy users in the home. An older model will cause consumer to incur a large bill. Consider an upgrade to save energy and money.

Take advantage of natural lighting and save electricity by opening your curtains.

Always use the correct pot size on stove burners. Did you know that a 6” on an 8” burner wastes over 40% of the burners heat? It is always cheaper to use natural gas than an electric stove.
